

Ideation Phase

Brainstorm & Idea Prioritization Template

Date	02 July 2026
Team ID	SWTID-2026-4978
Project Name	Strategic Product Placement Analysis
Maximum Marks	4 Marks

Brainstorming provides a free and open environment that encourages everyone within a team to participate in the creative thinking process that leads to problem solving. Prioritizing volume over value, out-of-the-box ideas are welcome and built upon, and all participants are encouraged to collaborate, helping each other develop a rich amount of creative solutions.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Our team gathered to isolate our analytical focus using the project data fields. The core problem statement selected for this session is: "How can retail store operations leverage transactional metrics to empirically identify which shelf placement configurations (Aisle, End-cap, Front of Store) maximize baseline sales volumes across distinct product categories and customer demographics?"

Step-2: Brainstorm, Idea Listing and Grouping

Ideas were generated freely and compiled into key analytical cluster groups matching the required dashboard features:

- **Cluster 1: Spatial Layout Dynamics**

- Idea 1.1: Build a spatial Treemap chart to visually rank category sales volume performance by floor display positions.
- Idea 1.2: Establish a packed bubble chart to map foot traffic density numbers against conversion rates.

- **Cluster 2: Consumer Profile Gaps**

- Idea 2.1: Design demographic donut charts to map out isolated volume demands for Families, Students, and Seniors.
- Idea 2.2: Implement cross-sheet global interaction filters to instantly bind demographic selections with floor maps.

- **Cluster 3: Market Gaps & Campaign Modalities**

- Idea 3.1: Construct dual bar charts to compare average store prices directly against regional competitor baselines.

- Idea 3.2: Create a text table promotion impact matrix to calculate exact sales volume lifts across campaign groups.

Step-3: Idea Prioritization

Following the matrix structure from our prioritization canvas layout, generated approaches were plotted across the Feasibility and Importance axes to extract the optimal implementation roadmap:

Proposed Concept	Feasibility Rating	Importance Rating	Action Plan Matrix Placement
8-Sheet Consolidated Tableau Dashboard Layout	High feasibility (Native calculations)	Critical importance (Core requirement)	High Priority (Implement Immediately)
Global Demographic Filter Linkages	High feasibility (Dashboard actions)	High importance (Core insight)	High Priority (Implement Immediately)
Competitor Price Gap Benchmark Graph	Medium feasibility	High importance	Medium Priority (Include in Final Story)
Manual Layout Adjustments without Data Visuals	Low feasibility (No standard engine)	Low importance	Rejected / Dropped from Scope

Conclusion & Next Steps: The highest priority ideas have been selected and successfully integrated into our final 8-point Tableau story workflow, enabling store operations managers to substitute intuitive guessing routines with definitive, data-backed placement strategies.
