

Ideation Phase

Customer Journey Map Template

Stages	1. Entice	2. Enter	3. Engage	4. Exit	5. Extend
Steps	Manager encounters static reports, noticing revenue drops due to poor layout arrangements.	Initiates project setup by importing raw product positioning CSV logs into Tableau.	Builds individual worksheets to evaluate volume metrics, demographics, and competitor prices.	Compiles sheets into a single, comprehensive dynamic dashboard layout.	Presents insights to executives to optimize real-world retail store layouts.
Interactions	Reviews Excel sheets, notices underperforming end-caps and buried clothing lines.	Configures data source connections, validating rows and column variables in workspace.	Applies filters, creates donut charts for demographics, and tracks competitor price gaps.	Deploys cross-sheet global interaction filters to bind data maps together.	Exports final dashboard package (.twbx) and uploads code artifacts to GitHub.
Goals & Motivations	Find an empirical way to stop relying on guesswork for retail display selections.	Ensure clean data connections without structural anomalies or broken links.	Isolate hidden trends linking location metrics with localized customer demands.	Deliver an interactive toolkit for category planners to test space layouts instantly.	Secure executive approval for physical shelf changes to boost conversion rates.
Positive Moments	Recognizes that raw sales logs contain valuable spatial attributes.	Data integrates smoothly into Tableau fields without schema conflicts.	Clear spikes appear showing students buy higher clothing volumes at storefront zones.	Action filters work perfectly across all 8 integrated sheets simultaneously.	Operational leaders praise the transition to clear visual analysis.
Negative Moments	Frustrated by dense rows that are impossible to quickly present to management.	Data requires manual verification to confirm consistent category nomenclature.	Takes time to isolate campaign promotion impacts from permanent shelf positioning lift.	Managing spatial chart spacing without cluttering layout view takes adjustment.	Real-world shelf reorganization requires physical labor and temporary floor downtime.
Areas of Opportunity	Establish a clear problem statement framework to anchor dashboard objectives.	Automate database intake connections to eliminate manual CSV drag-and-drop tasks.	Document exact calculated fields for competitor benchmark indices early.	Design clean instructions directly on the dashboard canvas view for operators.	Plan automated periodic refreshes to match evolving monthly sales logs.
